

Ring Shape Isolators

These isolators are developed in accordance with particular specification, in different application fields and the purpose is only to give you an overview of the wide range of possibilities of realizations we are able to propose thanks to our know-how, development tools and experience, without any detailed features

Ring shape and similar isolators

This series are also proposed in the same field of applications than conical isolators but often when it's necessary to allow a larger sway space, and preferably for gyroscopic platforms when the suspended mass has a cylindrical design

The technical and manufacturing features are the same as for conical dampers, but the axial to radial behaviour are linked to the moulding tool

It's possible to reach lower resonance frequencies with this design and higher dynamic vibration levels for a very small size of damper
